SEARCH REQUEST FORM 254870

Requester's Full Name: Cecilia Jaisle Examiner #: 82615 Date: 3-20-08
Art Unit: 1624 Phone Number: 2-9931 Serial Number: 10/589875
Location (Bldg/Room#): REM 5A28 (Mailbox #): 5C18 Results Format Preferred (circle): PAPER DISK

To ensure an efficient and quality search, please attach a copy of the cover sheet, claims, and abstract or fill out the following:

Title of Invention: See Bib Data Sheet
Inventors (please provide full names):

Earliest Priority Date:

Search Topic:
Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc., if known.

For Sequence Searches Only *Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.*

See claims attached. Please do structure search and inventor name(s) search. Display results to show identification of source, and RN #, compound name & structure of identified compounds. Search compounds of formula I where Ring (1) is

L4
L8

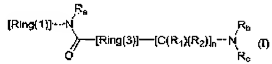
Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

1. – 31. (Cancelled)

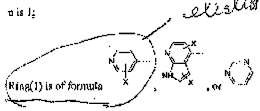
32. (New) A compound according to formula I:



R_a is not defined in Claim 32

wherein

n is 1;



elastic rubber matter

Ring(1) is of formula , or

wherein -X may be absent or denotes substitution with 1-4 substituents X that are independently chosen from halogen, C_1-C_6 alkyl, C_1-C_6 alkoxy, substituted or unsubstituted aryl, nitro, hydroxyl and a substituted or unsubstituted amino group;

Ring(3) is a 1,3-phenylene, 1,4-phenylene, 1,3-cyclohexylene, or 1,4-cyclohexylene optionally substituted with 1-4 substituents that are independently selected from halogen, C_1-C_6 alkyl, C_1-C_6 alkoxy, substituted or unsubstituted aryl, nitro, hydroxyl, an amino group;

R_a is hydrogen; a linear or branched, optionally substituted C_1-C_6-alkyl; a linear or branched, optionally substituted C_1-C_6-alkoxy; or an optionally substituted aryl;

represents a group selected from

and ; and

R_4 is selected from the group consisting of hydrogen; a substituted or unsubstituted, saturated, unsaturated or aromatic 3-, 4-, 5-, 6-, 7-or 8-membered ring containing carbon atoms and optionally one or two heteroatoms; substituted or unsubstituted C_1-C_8 alkyl and cyano,

H/Cy/NR2/CN

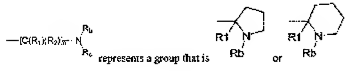
or a salt, pharmaceutically acceptable salt, pharmaceutically acceptable prodrug, tautomer, isomer, and/or stereochemical isomer thereof.

33 (New) The compound according to claim 32, wherein

Ring(1) is of formula  or ;

Ring(3) is of formula  ,

wherein -Y may be absent or denotes substitution with 1-4 substituents Y that are independently chosen from halogen, C_1-C_8 alkyl, C_1-C_8 alkoxy, substituted or unsubstituted aryl, nitro, hydroxyl, and an amino group; and



represents a group that is or .

OTHER SOURCE(S): MARPAT 143:266951

AB The invention provides the use of carboxamides ([Ring(1)]- N(Ra)C(O)[Ring(3)]-(CR1R2)n-NRbRc (I); variables defined below; e.g. 4-(1-aminoethyl)-N-(pyridin-4-yl)benzamide dihydrochloride (II)) or a composition comprising said compound for inhibiting the activity of at least one kinase, other than ROCK kinase, in vitro or in vivo, pharmaceutical and/or veterinary compns. comprising such compds., medical and veterinary uses of such compds. and the compds. themselves. 44 Examples of I were tested for inhibition of epsilon, gamma, theta and zeta isoforms of protein kinase C. Although the methods of preparation are not claimed, .apprx.60 example prepns. are included. For example, II was prepared (92 and 61 %) in 2 steps starting with amide formation between 4-acetylbenzoic acid and 4-aminopyridine to give 4-acetyl-N-(pyridin-4-yl)benzamide, which was condensed with NH2OH·HCl to give the oxime that was reduced to the amine. For I: Ring(1) is a (un)substituted, saturated, unsatd. or aromatic 4-8-membered ring containing C atoms and at least one H-accepting heteroatom and optionally 1 or 2 further heteroatoms; Ra is a H or a linear or branched, (un)substituted C1-C6 alkyl, (un)substituted C1-C6 alkoxy or (un)substituted aryl; Ring(3) is a (un)substituted, saturated, unsatd. or aromatic 4-8-membered ring containing C atoms and optionally 1 or 2 heteroatoms; each R1 or R2 = H, a (un)substituted, saturated, unsatd. or aromatic 3-8-membered ring containing C atoms and optionally one or two heteroatoms, (un)substituted C1-C6 alkyl or cyano; n = 0-2. Rb and Rc are such that the amino group -NRbRc is essentially in a protonated form at a pH = 5.0-9.0; the distance between the at least one H-accepting heteroatom in Ring(1) and the N(Ra)(Rb) N atom, as determined using a scatter plot, is 11.0-11.8 Å; addnl. details are given in the claims.

IT 863769-39-5P, N-(Pyridin-4-yl)-4-(pyrrolidin-2-yl)benzamide dihydrochloride 863769-41-9P, 4-(Piperidin-2-yl)-N-(pyridin-4-yl)benzamide dihydrochloride 863769-46-4P, 4-(4,5-Dihydro-1H-imidazol-2-yl)-N-(pyridin-4-yl)benzamide 863769-47-5P, N-(Pyridin-4-yl)-4-(1,4,5,6-tetrahydro-1H-pyrimidin-2-yl)benzamide 863769-70-4P, 4-(Piperidin-2-yl)-N-(1H-pyrrolo[2,3-b]pyridin-4-yl)benzamide dihydrobromide 863770-06-3P, N-(Pyridin-4-yl)-4-(pyrrolidin-2-yl)benzamide 863770-07-4P, 4-(Piperidin-2-yl)-N-(pyridin-4-yl)benzamide 863770-15-4P, 4-(Piperidin-2-yl)-N-(1H-pyrrolo[2,3-b]pyridin-4-yl)benzamide

AB Title compds. I [A = N, CR4, a carbon atom bound to L, or is not an atom; one of W, Z, B, Y, X = carbon atom bound to L if A is not an atom, another of W, Z, B, Y, X = carbon atom bound to G, and each of the remaining W, Z, B, Y and X is independently N or CR4; L = bond, (CH2)n; n = 1-3; G = CO, CS, SO2; R1 =

alkyl, heteroalkyl, aryl, etc.; R2 = H, alkyl; R3 = alkyl, heteroalkyl, aryl, etc.; R4 = H, alkyl, etc.] are prepared For instance, 4-(3-chloropyridin-2-yl)-N-(4-(trifluoromethyl)phenyl)benzamide (II) is prepared from 4-(3-chloropyridin-2-yl)benzoic acid (preparation given) and 4-trifluoromethylaniline (CH2Cl2, CO2Cl2, DMF). II did not significantly inhibit CYP2C9, CYP2D6 and CYP3A4 but exhibits inhibition for CYP2C19 (IC50 = 26.85 μM) and CYP1A2 (IC50 = 97.45 μM). I are useful in the treatment of pain, inflammation and traumatic injury.

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB A series of N-(acridin-9-yl)-4-(benzo[d]imidazol/oxazol-2-yl) benzamides has been synthesized by the condensation of 9-aminoacridine derivs. with benzimidazole or benzoxazole derivs. Condensation of 2-hydroxy naphthaldehyde with functionalized diamines leads to the formation of Schiff's bases and not imidazole derivs. All these compds. were characterized by correct FT-IR, 1H NMR, MS and elemental analyses. These compds. were screened for anti-inflammatory, analgesic and kinase (CDK-1, CDK-5 and GSK-3) inhibition activities. Compds. (I) and a mixture (II, III) showed good anti-inflammatory (35.8% at 50 mg/kg po) activity and good analgesic activity (60% at 50 mg/kg po), resp. Compound (IV) showed significant in vitro activity against CDK-5 (IC50 = 4.6 μM) and CDK-1(IC50 = 7.4 μM) and compound (V) showed moderate CDK-5 inhibitory activity (IC50 = 7.5 μM). The other compds. showed moderate anti-inflammatory and analgesic activities.

NOVELTY - Aromatic amide compounds (I) (capable of modifying ion channels in vivo) and their salts, solvates, prodrugs or stereoisomers are new.

DETAILED DESCRIPTION - Aromatic amide compounds of formula (I) (capable of modifying ion channels in vivo) and their salts, solvates, prodrugs or stereoisomers are new.

A = N, CR4, C bound to L or is not atom (one of W, Z, B,Y, X is C atom bound to L if A is not an atom, another of W, Z, B, Y, X is a C bound to G and each of the remaining W, Z, B, Y and X is N or CR4);

L = bond or -(CH2)n;

n = 1-3;

G = CO, CS or SO2;

R1, R3 = aliphatic (optionally substituted), (hetero)alkyl, (hetero)aryl or (hetero)aralkyl;

R2 = H or optionally substituted alkyl; and

R4 = H, alkyl (optionally substituted), acyl, acylamino, alkylamino, alkylthio, alkoxy, alkoxycarbonyl, alkylarylamino, arylalkyloxy, amino, aryl, arylalkyl, sulfoxide, sulfone, sulfanyl, aminosulfonyl, arylsulfonyl, sulfuric acid, sulfuric acid ester, dihydroxyphosporyl, aminohydroxyphosphoryl, azido, carboxy, carbamoyl, carboxyl, CN, cycloheteroalkyl, dialkylamino, halo, heteroaryloxy, heteroaryl, heteroalkyl, OH, NO2 or thio.

An INDEPENDENT CLAIM is also included for the preparation of (I).

ACTIVITY - Analgesic; Immunosuppressive; Antiinflammatory; Neuroprotective; Antimigraine; Antiparkinsonian; Nootropic; Cerebroprotective; Vasotropic; Antidepressant; Antimanic; Neuroleptic; Tranquilizer; Eating-Disorders-Gen.; Hypnotic; Anticonvulsant; Gastrointestinal-Gen.; Uropathic; Respiratory-Gen.; Antiallergic; Antiasthmatic; Antiarthritic; Antirheumatic; Osteopathic; Cardiant; Ophthalmological; Antiarteriosclerotic; Antipruritic; Antipsoriatic; Endocrine-Gen.; Anorectic; Cytostatic; Vulnerary; Nephrotropic.

MECHANISM OF ACTION - Vanilloid receptor (VR-1) agonist. (I) were tested for VR-1 agonist activity using imaging assay. The result showed that the percentage inhibition value of (I) was 75%.

USE - (I) are useful for the treatment, prevention, amelioration or management of pain condition, autoimmune disease, inflammatory disease or condition, neurological or neurodegenerative disease, pain including acute, inflammatory and neuropathic pain, chronic pain, dental pain, headache including migraine, cluster headache and tension headache, Parkinson's disease, Alzheimer's disease, multiple sclerosis, diseases and disorders mediated by or result in neuroinflammation, traumatic brain injury, stroke, or encephalitis, centrally-mediated neuropsychiatric diseases and disorders including depression, mania, bipolar disease, anxiety, schizophrenia, eating disorders, sleep disorders and cognition disorders, epilepsy and seizure disorders, prostate, bladder and bowel dysfunction, urinary incontinence, urinary hesitancy, rectal hypersensitivity, fecal incontinence, benign prostatic hypertrophy and inflammatory bowel disease, respiratory and airway disease and disorders including allergic rhinitis, asthma and reactive airway disease and chronic obstructive pulmonary disease, diseases and disorders mediated by or result in inflammation including arthritis, rheumatoid arthritis and osteoarthritis, myocardial infarction, autoimmune diseases and disorders, uveitis and atherosclerosis, itch/pruritus, psoriasis, alopecia (hair loss), obesity, lipid disorders, cancer, high blood pressure, spinal cord injury or renal disorders. (I) are useful for the treatment of symptom such as symptoms of exposure to capsaicin, burns or irritation due to exposure to heat, light or burns (all claimed).

ADVANTAGE - (I) exhibited improved aqueous solubility and metabolic stability.

AB The title compds. I [wherein m = 0-2; n = 0-4; p, s, t independently = 0 or 1; R1, R2 independently = H, halo, alkyl, etc.; A = (un)substituted Ph, pyridinyl, pyrrolyl, thiophenyl or furanyl; Z = certain (un)substituted nitrogen heteroaryl] and N-oxides, salts, or stereoisomers thereof are prepared as inhibitors of the interactions between MDM2 and p53. For example, compound II was prepared in a multi-step synthesis. I showed inhibitory effect in both p53 ELISA assay and cell proliferation assay. The invented compds. are useful for the treatment of disorders mediated by p53-MDM2 interactions.

II

AB The invention provides a modulator of the TRPV1-receptor function, comprising a compound of the formula I. Compds. of formula I wherein A is (un)substituted (mono/bi)cyclic carbocycle, and (un)substituted (mono/bi)heterocycle; ring B is (un)substituted benzene, (un)substituted 6-membered heteroarom. ring containing N atom; R1 is H, (un)substituted lower alkyl and (un)substituted acyl; dashed line is a single or double bond; when dashed bond is a double bond, then n is 0; X is =CRx, and =N; R3 and R4 are taken together to form (un)substituted 5- to 6-membered nonarom. heterocycle; Rx is H, halo, lower (halo)alkyl, lower (halo)alkoxy and acyl; or X is =N; R3 is lower alkyl; R4 is lower alkoxy and aryloxy; when dashed bond is single bond, n is 1; R2 is H, (un)substituted lower alkyl; X is O, S, and NH and derivs.; R3 and R4 taken together for forum and (un)substituted nonarom. 5-to 6-membered heterocycle; and their pharmaceutically acceptable salts thereof, are claimed. Example compound II was prepared by amidation of 4-acetylbenzoic acid with 4-tert-butylaniline; the resulting N-(4-tert-butylphenyl) 4-acetylbenzamide underwent acetalization with 1,3-propanediol to give compound II. All the invention compds. were evaluated for their TRPV1 modulatory activity. From the assay, it was determined that compound II exhibited an IC50 value of 297 nM.

I II

AB The invention relates to compds. of formula I, which inhibit dipeptidyl peptidase IV (DPP-IV) and are useful for the prevention or treatment of diabetes, especially type II, as well as hyperglycemia, metabolic syndrome, hyperinsulinemia, obesity, atherosclerosis, various immunomodulatory diseases, and other diseases. Compds. of formula I wherein R1 is H, (halo)alkyl, (hetero)aryl, heterocyclyl, cycloalkyl, cycloalkenyl, etc.; R2 is H, (halo)alkyl, cycloalkyl, heterocyclyl, (hetero)aryl, heterocyclealkyl, etc.; R3 is H and (halo)alkyl; dotted line is optional double bond; Ar1 is (un)substituted (hetero)aryl; and their pharmaceutically acceptable salts, metabolites, prodrugs, salt of prodrugs, and combinations thereof, are claimed. Example compound II was prepared by cyclization of 1,3-butadiene with 2-chloro-β-nitrostyrene; the resulting trans-1-chloro-2-(6-nitrocyclohex-3-en-1-yl)benzene underwent reduction to give compound II. All the invention compds. were evaluated for their DPP-IV inhibitory activity.

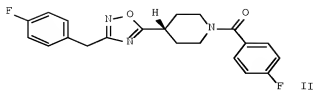
P—X—A—Y—W—B—Q I



II

AB The invention relates to compds. which are heterocyclic derivs. of formula I. Compds. of formula I wherein W is (un)substituted C5-7 (hetero)cycloalkyl, and (un)substituted C5-7 heterocycloalkenyl; P and Y are independently (un)substituted (hetero)cycloalkyl and (un)substituted (hetero)aryl; A is N=N, Et, ethenyl, ethynyl, NHCO and derivs, NHSO2 and derivs., etc.; B is a single bond, CO-C0-2 alkyl, CO-C2-6 alkenyl, CO2, etc.; X and Y are independently a bond, NHCO2 and derivs., (un)substituted C1-6 alkyl, C2-6 alkenyl, C2-6 alkynyl, c3-7 cycloalkyl, etc.; and their pharmaceutically acceptable salts, hydrates, solvates and N-oxides are claimed. Invention compds. are useful for treating central or peripheral nervous system disorders and other disorders which are affected by the neuromodulatory effect of mGluR5 pos. allosteric modulators such as cognitive decline and also to treat both pos. and neg. symptoms in schizophrenia. Example compound II was prepared by condensation of 4-fluorophenylacetonitrile with hydroxylamine followed by cyclization with (S)-1-Boc-piperidine-3-carboxylic acid; the resulting (S)-3-[3-(4-fluorobenzyl)-[1,2,4]oxadiazol-5-yl]piperidine-1-carboxylic acid tert-Bu ester underwent hydrolysis to give the corresponding piperidine hydrochloride, which underwent amidation with 4-fluorobenzoyl chloride to give compound II. All the invention compds. were evaluated for their pos. allosteric modulator activity of mGluR5. From the assay, it was determined that compound II exhibited an EC50 value of < 1 μM.

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB The invention relates to heterocyclic compds. of formula I, compns. including the compds. and methods of using and methods of making thereof. The compds. (and compns.) are useful, inter alia, in modulating IL-12 production and processes mediated by IL-12. Compds. of formula I wherein X and R1, taken together, are CONR'R''; X is (un)substituted (thio)carbonylamino, (un)substituted amino(thio)carbonyl, C(=NH)NH and derivs., NHC(NH) and derivs., (un)substituted amino(thio)carbonylamino, NHC(=NH)NH and derivs., etc.; R1 is R6-L-R7; R6 is (un)substituted (hetero)cycloalkyl, (un)substituted cyclyl, (un)substituted (hetero)aryl(alkyl), or absent; L is O, S, SO, SO2, NH and derivs., NHCO and derivs., CONH and derivs., COO or OCO or absent; R7 is H, (un)substituted alkyl, (un)substituted cyclyl, (un)substituted (hetero)cycloalkyl, (un)substituted (hetero)aryl(alkyl) etc; Q, U, and V are independently N or CRg, wherein at least one of Q, U or V is N; R3 is Rg, CHO and derivs., (thio)formyl, (oxy)acyl, sulfanyl(thio)acyl, amino(thio)acyl, C(=NH)H and derivs., etc.; Rg, R2 and R4 are independently H, (un)substituted alkyl(carbonyl), OH and derivs., SH and derivs., NH2 and derivs., hydroxyalkyl, (thio)formyl, (oxy)(thio)acyl, sulfanyl(thio)acyl, etc.; R' and R'' are independently H, (un)substituted alkyl, (un)substituted alkenyl, (un)substituted alkynyl, (un)substituted (hetero)cyclyl, (un)substituted (hetero)cycloalkyl, (un)substituted (hetero)aryl(alkyl), etc; G is hydrazide, hydrazone, hydrazine, hydroxylamine, oxime, amide, ester, carbonate, carbamate, etc; W is O, S, SO, SO2, NH and derivs., aminoacyl; m is 0-4; and their pharmaceutically acceptable salts, solvates, clathrates, hydrates, or polymorphs are claimed. Example compound II was prepared by substitution of Me 2,4-dichloropyrimidine-6-carboxylate with N-(2-hydroxyethyl)morpholine to give Me 2-chloro-6-[2-(morpholin-4-yl)ethoxy]pyrimidine-6-carboxylate, which reacted with morpholine to give Me 2-morpholino-6-[2-(morpholin-4-yl)ethoxy]pyrimidine-6-carboxylate, which underwent amidation with 5-amino-2,3-dimethylindole to give example compound II. All the invention compds. were evaluated for their IL-12 inhibitory activity. From the assay, noumerous of the invention compds. exhibited in vitro IC50 values < 1μM against human PBMC or THP-1 cells.

II

AB The invention is related to the preparation of heteroaryl compds. I [Q, U, V = independently N, CH and derivs.; Z = H, NH2 and derivs., OH and derivs., (un)substituted cyclo/alkyl, etc.; X = O, S, SO, CO, N:N, NHCO, etc.; R = R'-L'-R''; R' = (un)substituted cycloalkyl, cyclyl, aryl, etc.; L' = O, S, NH and derivs., absent, etc.; R'' = H, OH and derivs., halo, CN, alkyl, aryl, etc.; R1 = (CR2R4)n-G-R3; Y = CO, O, S, NH and derivs., absent, etc.; R3 = H, (un)substituted alk(en/yn)yl, heteroaryl, OSO2H, CHO, etc.; R2, R4 for each occurrence = independently (un)substituted alkyl, alkylcarbonyl, OH and derivs., NO, halo, CN, etc.; G = NH-C(NH)-NH, NH-CO-NH, NH-CS-NH, hetero/arylene, absent, etc.; n = 0-7], and pharmaceutically acceptable salts, solvates, clathrates, hydrates, prodrugs, and polymorphs thereof. The invention is also related to methods of modulating IL-12 production and

processes mediated by IL-12. E.g., a 4-step synthesis from 2,4,6-trichloropyrimidine and diethylamine was given for hydrazone II. I inhibited IL-12 production in human PBMC cells and THP-1 cell line in an in vitro assay. Thus, I are useful for treating or preventing disorders related with excessive bone loss, methods for inhibiting osteoclast formation, and methods for treating or preventing a disorder associated with excessive bone resorption.

AB Title compds. I [wherein A = 5-membered cycle; R1 = (un)substituted (hetero)aryl; R2 (adjacent to R1) = absence, H, carboxamide, (un)substituted (hetero)aryl, carbocycle or heterocycle; R3 (adjacent to R2) = absence, H,

(un)substituted cycloalky(en)yl, alk(en/yn)yl, carboxyl, carboxamide or ester; with some limitations, or salts, N-oxides, hydrates or solvates thereof] were prepared as heat shock protein 90 (HSP90) inhibitors. Thus, 5-chloro-2,4-dimethoxyphenylamine was treated with NaNO2 in the presence of H2SO4 followed by the addition of NaN3. The resultant azide underwent cyclization with 3-(4-fluorophenyl)-3- oxopropionic acid Me ester gave intermediate II (X = OMe, R= OH). Demethylation of this compound with 48% HBr followed by esterification with EtOH yielded triazolecarboxylate II (X = OH, R = OEt), which showed IC50 <10 μM for binding to HSP90 in a fluorescence polarization assay. Therefore, I and their compns. are useful for immunosuppression or the treatment of cancers, viral disease, inflammatory diseases and so on.

AB Compds. of the general formula (I) or pharmacol. acceptable salts thereof [wherein X is :CH or N; Y is NH, NR4, S, O, CH:N, N:CH, N:N, CH:CH, or the like; R1 is lower alkoxy, amino, a nitrogenous heterocyclic group, or a hydroxyl group substituted with a heterocyclic group (wherein each group may be substituted); R2 is either a lower alkylamino or lower alkoxy group which may be substituted with aryl, or a lower alkoxy group substituted with a nitrogenous aromatic heterocyclic group; and R3 is aryl, a nitrogenous heterocyclic group, lower alkyl, lower alkoxy, lower cycloalkoxy, a hydroxyl group substituted with a nitrogenous heterocyclic group, or amino (wherein each group may be substituted), or alternatively, R3 and the substituent of Y may be united to form a lactone ring] or pharmacol. acceptable salts thereof are prepared These compds. exhibit excellent PDE V inhibitory activity and are useful as preventive or therapeutic agents for various diseases due to dysfunction of the signal transduction through cGMP, in particular impotence, pulmonary hypertension, and diabetic renal failure paralysis (no data). Thus, 2-(hydroxymethyl)pyridine was treated wit NaH in THF at room temperature for 30 min and then condensed with 2-chloro-5-(3,4,5-trimethoxyphenylcarbonyl)-4-(3-chloro-4- methoxybenzylamino)pyrimidine (preparation given) in THF at room temperature for 1 h to give 2-(2-pyridylmethoxy)-5-(3,4,5-trimethoxyphenylcarbonyl)-4-(3- chloro-4-methoxybenzylamino)pyrimidine.

I II

AB The title compds. [I; rings D-E represent guanidine mimics; ring D = CH2N:CH, CH2CH2N:CH, a 5-6 membered aromatic system containing 0-2 heteroatoms selected form the group N, O, and S; ring D is substituted with 0-2 R (substituents), provided that when ring D is unsubstituted, it contains at least one heteroatom; ring E contains 0-2 N atom and is substituted by 0-1 R; R = halo, OH, C1-3 alkoxy, etc.; M = (un)substituted pyrazole, imidazole, tetrazole, etc.], inhibitors of factor Xa which are useful in treating and preventing a thromboembolic disorder, were prepared and formulated. Thus, a multi-step synthesis of the title compound II, starting with 7-aminoisoquinoline, was described. A number of compds. I were found to exhibit a Ki of ≤ 15 μM against factor Xa.

AB   A silicate glass suitable as optical material for extreme-UV lithog. has a low
     coefficient of thermal expansion over 0-100° (0±250 ppb/°C), and is produced
     without formation of concave defects during polishing to achieve a high level
     of flatness.  The silica glass contains 0.1-10% of SnO2 and 3-10% of TiO2, and
     has a homogeneity of the coefficient of thermal expansion at 0-100° of 50-200
     ppb/°C, and a Vickers hardness ≤650.

AB The method involves applying a suspension containing SiC particles having average diameter 0.01-150 μm on a molding surface side of a graphite mold to satisfy coating weight per unit area 0.005-0.2 g/cm2, setting TiO_2-containing glass in the mold, and press-molding the glass at 1500-1800° to give a molded glass with desired shape. Bubble generation during molding is prevented, so that the molded glass is suitable for optical parts used in EUV lithog.

AB Conventional TiO2-SiO2 glass contains hydrogen atoms which, during deposition under ultrahigh vacuum conditions, will diffuse in the chamber and H2 mols. will be taken into the film formed. Hydrogen mols. will readily diffuse and thus change the optical characteristics of the multilayer film. In an optical material for EUV lithog., a multilayer film is deposited by ion beam sputtering on a silica glass having a TiO2 concentration of 3-12 mol.% and a hydrogen mol. content <5x1017 mols./cm3 in the glass.

AB A TiO2-containing silica glass with zero coefficient of thermal expansion over a wide temperature range comprises 3-10 weight% of TiO2, a OH group concentration of at most 600 ppm by weight and a Ti3+ concentration <70 ppm by weight The glasses have a fictive temperature of 1200° or less, a coefficient of thermal expansion of 0±150 ppb/°C over 0-100° range, and an internal transmittance T400-700 per 1 mm thickness at 400-700 nm of at least 80%. The TiO2-doped silicate glasses are produced by forming a porous glass body, fluorine-doping before oxygen treatment, densification and vitrification.

AB In the production process, flame hydrolytically deposited porous TiO2-SiO2 glass soot preforms are heated in nonreducing atmospheric to 1100-1650° to give sinters with d. of 2.0-2.3 g/cm3, then further heated to 1400-1700° in atmospheric of ≥0.01 Mpa for vitrification into high-transparent glass. Preferably, the resultant glass is heated to a temperature of equal to or above softening point and formed into desired shape. In the production, fluorine doping may be carried out so as to widen the temperature range of zero thermal expansion coefficient The production process inhibits generation of Ti3+ during sintering, so that the glass shows high transparency and is suitable for EUV (extreme-UV) lithog. exposure apparatus

AB The glass having Young's modulus ≥85 GPa consists of SiO2 60-72, Al2O3 2-9, MgO 3-9, CaO 2-10, SrO 0-15, ZnO 0-4, TiO2 0-8, ZrO2 0-4, Li2O 1-12, Na2O 0-8, K2O 0-5, Y2O3 0-5, and La2O3 0-5 mol% and the amount of Li2O, Na2O, and K2O is 4-15 mol%. The substrate for the magnetic recording medium is made of the glass and number of fixed substances with size ≥10 μm is ≤1/cm2 and the substances with size from ≥1 μm to <10 μm is ≤105/cm2 both on the surface after 20 h in steam at 120° and 2 atmospheric The substrate with high Young's modulus and weather resistance is suitable for mass production of magnetic disks.

AB In extreme UV (EUV) lithog. technol., ultra low thermal expansion material is required as photomask substrate. We have previously developed Ti-doped silica glass which exhibits both ultra low coefficient of thermal expansion (CTE) and high homogeneity for EUV substrate. On the other hand, we have been investigating other candidate materials which have low CTE, from the viewpoint of structural chemical Silica glass is well-known as a low thermal expansion material and the reason is explained that in the open structure of silica glass two factors, expansion and shrinkage, compete with each other with increase in temperature The network of silica glass consists of tetrahedra like quartz crystal. In this structure, Si is stably present with a valence of 4 and a coordination number of 4. We have carried out an atomistic simulation and estimated the volume change of oxide materials which may have the same structural transformation mechanism as SiO2. As a result, the volume of SnO2 with quartz structure (quartz-SnO2), in which Sn was present with a valance of 4 and a coordination number of 4, decreased with increase in temperature, i.e., the d. of quartz-SnO2 increased. Thus, it was indicated that the glass with lower CTE than that of silica glass could be obtained with

substituting Sn for Si. Based on this hypothesis, we have prepared Sn-doped silica glass by Asahi silica glass producing method. The synthesized Sn-doped silica glass exhibited lower CTE than that of an ordinary silica glass.

AB Temperature dependences of optical path length (dS/dT; calculated using the equation, dS/dT = dn/dT + na, where a is coefficient of thermal expansion, n is refractive index and dn/dT is temperature coefficient of refractive index) in various oxide glasses were investigated. The dS/dT is generally difficult to adjust by change of glass composition because dn/dT and a are interrelated. However, low dS/dT materials are desired for optical applications such as athermal devices, and high dS/dT materials can be used for thermo-optic devices. Pure silica glass is well-known as a typical low dS/dT material but still not sufficient. Fluorine-doped silica glass showed a lower dS/dT than that of pure silica glass. By fluorine-doping in silica glass, refractive index and dn/dT decreased but a near room temperature stayed at the same level. As a result, the dS/dT decreased with increasing fluorine concentration On the other hand, bismuthate glass showed the highest dS/dT in this study. Most glasses having high a such as tellurite glass showed neg. dn/dT. However, bismuthate glasses showed pos. dn/dT in spite of high a. As a result, bismuthate glasses showed quite high dS/dT. These results indicate that dS/dT of the glass can be controllable and that fluorine doped silica glass and bismuthate glass are appropriate candidate materials for optical applications.

AB Temperature dependences of optical path length (dS/dT; calculated using the equation, $dS/dT=dn/dT+n\alpha$, where α is the coefficient of thermal expansion, n is the refractive index and dn/dT is the temperature coefficient of refractive index) in various oxide glasses were investigated. The dS/dT is generally

difficult to be controlled by change of glass composition because dn/dT and α are interrelated. This experiment also showed that the values of dS/dT for most glasses ranged between 10 ppm/° and 20 ppm/° except for bismuthate glasses. Pure silica glass is well-known as a typical material with low dS/dT. However, fluorine-doped silica glass showed a lower dS/dT than that of pure silica glass. By fluorine-doping in silica glass, refractive index and dn/dT decreased but α stayed at the same level near room temperature As a result, the dS/dT decreased with increasing fluorine concentration On the other hand, a bismuthate glass showed the highest dS/dT in this study. Although most glasses having high α such as tellurite glass showed neg. dn/dT, bismuthate glasses showed pos. dn/dT in spite of high α. It was assumed that bismuthate glass showed high dn/dT due to high polarizability of Bi2O3 which is similar to PbO. These results indicate that dS/dT of glass can be designed by considering the electronic configuration of its components and the glass structure.

NOVELTY - A process gas is supplied to a furnace core pipe (12) in which porous glass is accommodated. The furnace core pipe is installed in a chamber (14) provided with a heater (28), and sealed by a seal portion (16) having heat resistance and air permeability. While supplying an inert gas to the space (34) between chamber and furnace core pipe, the pressure of the space is controlled higher than the pressure in the furnace core pipe.
DETAILED DESCRIPTION - An INDEPENDENT CLAIM is included for processing apparatus (10) of porous glass.
USE - For processing porous glass used in manufacture of optical material used for optical lithography using extreme UV light as exposure light source.
ADVANTAGE - The method enables efficient processing of porous glass without requiring a large-sized heating furnace.
DESCRIPTION OF DRAWINGS - The figure shows the partial cross-section of the processing apparatus. (Drawing includes non-English language text)
Processing apparatus (10)

NOVELTY - Glass particles of titania-silica vitreous material are deposited at master rod (12). The rod suspended by rotation mechanism (16), is rotated at 25 rpm or more. Growth of porous titania-silica vitreous material is carried out at 5 kg or more in a state at which intrinsic frequency (f1) is more than oscillation number (f2) of rotating mechanism. The frequency (f1) is reduced and number (f2) is made unstable by weight increase of porous titania-silica vitreous material growth. Thus, manufacture of porous titania-silica vitreous material is enabled.
USE - For manufacturing porous titania-silica vitreous material used for manufacturing optical component used for optical lithography such as extreme ultraviolet light lithography.
ADVANTAGE - The porous titania-silica vitreous material of required weight is efficiently manufactured.
DESCRIPTION OF DRAWINGS - The figure shows the structural drawing of master-rod rotating mechanism of porous titania-silica vitreous material manufacturing apparatus.

NOVELTY - The optical element contains glass component having small optical path length change with respect to temperature change. The glass component optionally contains 1% or less of alkali metal oxide.
DETAILED DESCRIPTION - The optical element suitable for light of wavelength 450-1700 nm, contains glass as a component. The glass component has dS/dT (optical path length change/temperature change) of 8.9-10-6/degreesC or less satisfying the relation DS/dT = dn/dT+n(alpha), where dn/dT is temperature change rate at 25degreesC, alpha is coefficient of linear expansion at 25degreesC and n is refractive index with respect to light of wavelength 1550 nm. The glass component optionally contains 1% or less of alkali metal oxide. The glass contains 90-98.8 mass% silica, 1.2-10% fluorine, 0-8 mass% each of borate, alumina, phosphorous pentoxide and titania.
USE - Optical elements such as optical fiber grating, etalon (claimed), optical lens and prism.
ADVANTAGE - An optical element containing glass component with low alkali metal oxide content and small optical path length change with respect to temperature change, is obtained.

A lithographic plate material for laser direct make-up that comprises a recording layer is obtainable by pulsed-laser irradiation, which includes a thermoplastic polymer matrix with an absorption band in the UV region and particulates dispersed in it.
Also claimed is an offset printing method using the above lithographic plate material, including the steps of (a) manufacturing the plate material; (b) hydrophilicising the irradiated parts of the material by irradiating the surface of the recording layer with a pulsed laser to give the corresponding image; and (c) printing by application of ink for lithographic printing onto the surface of the recording layer and then printing.
USE - The lithographic plate material is for use in the printing industry.
ADVANTAGE - The recording layer of the lithographic plate material has superior print recovery properties, and such plate material provides good water retentivity in parts of the recording layer surface irradiated by laser, with hardly any scumming, thereby leading to lower printing costs and a cleaner print environment.
